Purpose of the Analysis

From the just concluded quarter 2 (Q2) 2025, performance appraisal, the senior management at Tech Company do not have clarity on the training and development Key Performance Indicators (KPI). Thus, they are unable to decide if staff welfare is presently being maximized in comparison to market realities.

Also, it is unclear to management, the data-driven views of how pay and performance interact across status (income and gender), departments and employment modalities. This hinders targeted retention initiatives and promotion decisions. Furthermore, it is not clear if the present yardstick employed to measure employees' performance and subsequent reward adheres to industry standards. Again, which income strata the salary payments to employees are concentrated can't be presently explained to management and it desires answers to this for strategic planning. As such, it has become mandatory to provide top leadership with evidence-based insight into compensation costs, promotion eligibility, performance drivers to support financial decisions and workforce planning.

The senior management at Tech Company wants to achieve the underlisted objectives from having answers to the shrouded areas mentioned above:

1. To reduce the level of attrition to 5% by Q4, 2025 via maximizing staff welfare.
2. To optimize cost by ensuring value for money is derived from staff performance.
3. To cement its place in the tech industry as a desired hub for prospective tech career applicants by offering competitive salaries and benefits.

Key Findings

The key findings from the analysis of the company's employee performance for Q3 are stated below:

- 1.) Of the five departments, Product had the highest number of staff (111) with over 4 years experience and performance score of at least 4.00.

- 4.) From the 1,000 staff strength of Tech company, majority of staff income is concentrated at the mid-level (414), which accounts for 41.4%, next high-income strata at 36.2% (362) and low income at 22.4% (224) respectively. Shown in fig.4 below is a chart displaying this.

- 5.) Based on staff's longevity in service (6 years) and performance score of at least 6.00, 389 staff members, representing 38.9% are eligible for promotion, with *Product department* topping the eligibility list at 86, followed by Management with 84. The pie chart in fig.5 below shows the number of eligible employees for promotion by department.

The following limitations constrained the depth of the interpretations in this analysis:

1. The city field is broad and lacks cost of living context, which is key for compensation analysis.
2. The data is a static snapshot, that is, not a time series data. Consequently, it can't be used to analyze trend of promotion, salary growth etc.
3. If vital fields like *Department*, *Performance Score*, *Salary* have blank cells, the analyses correlating performance to department or promotion to departments will be incomplete and consequently biased.

Recommendations

Based on the interpretation of the findings obtained, the following recommendations should be considered to improve staff welfare in Tech Company.

1. Conduct quarterly inter-departmental performance review to ensure HR leadership's rating is fair, consistent and reflects the true state of departmental performance.
2. Investigate departmental best practices by conducting a quality review of leadership styles, management practices, team dynamics and career development paths that support female talents and share these best practices with other departments to improve overall performance equity.
3. Implement a retention strategy for top performing staff with delayed promotion to avoid flight risk. This can be achieved by offering career development incentives in the immediate term, communicating a clear promotion eligibility criterion such as skill-based competence, behavioural competencies, leadership expectations and minimum performance threshold.
4. Address mid-level income compression and career progression bottleneck, which naturally could be a demotivating factor, by creating clear promotion pathway from mid to senior level, with clear criteria and development programmes.
5. Also, conduct surveys to specifically target mid-income levels to identify pain points, and launch mid-career accelerator programmes that prioritize leadership, technical specialization and strategic thinking.
